EDUCATION

Oregon State University — B.S. Computer Science

December 2026

Cumulative GPA: 3.7/4.0

Dean's List: 2022-2026

WORK EXPERIENCE

Data Engineering Intern — The Linux Foundation

Oct 2025 - Present

- Shipped 20+ dbt models powering a redesigned GitHub commit-tracking system, partnering with upstream teams to expand data visibility across analytics consumers.
- Automated marketing analytics workflows in dbt and SQL, eliminating ~40% of recurring manual query execution for the team.
- Aggregated multi-source engagement data via Kafka, Fivetran, and CrowdDev, surfacing trends that reshaped outreach strategy.
- Authored advanced SQL transformations to extract, clean, and join cross-platform marketing data for executive campaign performance reporting.

Cloud Engineering Intern — Daimler Truck North America

Mar 2025 - Sep 2025

- Delivered a Financial Operations Hub with a team of 5 that centralized global Azure spend tracking and identified a 32% reduction in cloud expenditure
- Engineered scalable ETL pipelines in Azure Data Factory using Bicep IaC, automating ingestion and transformation into Azure Data Explorer.
- Built KQL- and DAX-driven Power BI dashboards for resource utilization and scenario modeling, surfacing an additional 7% in per-application savings.
- Automated cost analysis tooling with PowerShell, YAML, and Azure REST APIs to continuously feed optimization insights to FinOps stakeholders.

PROJECTS

GlassBox — Hardware Security Audit Platform | github.com/cbgabler/glassbox

May 2026

1st | Best Agentic Infrastructure (BeaverHacks)

- Built a 6-stage embedded pipeline that flashes user C/C++ onto an ESP32 and confirms timing leaks via 1,000-trace TVLA at $|t|=4.5$ in ~3–6 min/target — recovering AES-128 round keys via 256-candidate CPA on power traces from an INA169 + Pico ADC
- Engineered a USB↔UART0 bridge that auto-flashes the ESP32 through the Pico (EN/GPIO0 reset translation), and a 6-rule static linter catching branch-on-secret, variable-time compares, and secret-indexed table reads pre-flash
- Designed a 6-server MCP agent system in GO exposing 15+ tools to an orchestrator (Claude/GPT/Nemotron) that drives end-to-end audits across 5 software scanners + hardware confirmation

Catalytica — Real-Time Wildfire Tracker | github.com/HackerManOSU/Catalytica

Apr 2025

1st | Google (BeaverHacks)

- Built a full-stack, AI-driven wildfire monitoring platform (React + TypeScript, Firebase, Leaflet) that surfaces NASA satellite hotspots, enriched weather, and population impact in real time for any U.S. location
- Architected a serverless backend on Firebase Cloud Functions and Firestore with a scheduled job that ingests NASA FIRMS VIIRS satellite detections every minute and enriches each hotspot with live OpenWeather data
- Engineered an interactive Leaflet heatmap with a four-tier Fire Radiative Power (FRP) classification system, layering pulsing severity markers and a Haversine-based 15-mile proximity filter

SKILLS

Technical Skills: Python, Bicep, JavaScript, C, C++, Bash, PowerShell, SQL, KQL, R

Platforms: Azure, AWS, GCP, Git, dbtLabs, Snowflake, Kafka, Arduino, SQLite, Postgres
